讨论: 本新种与所罗门群岛 (西太平洋)的Condeellum crucis Tuxen et Imadaté 1975相近,但两者的假眼、毛序及第Ⅰ腹足上的刚毛数等均不相同,可资区别。

## TEREE NEW SPECIES OF PROTURA FROM SICHUAN PROVINCE

Tang Bowei Yin Wenying (Shanghai Institute of Entomology, Academia Sinica)

The present paper describes three new species of Protura, which were collected from Sichuan Province, in the summer of 1985. The types are all deposited in Shanghai Institute of Entomology, Academia Sinica.

1. Hesperentomon sichuanensis sp. nov. (Figs. 1-8)

Total length 720—810 $\mu$ , head 80—82 $\mu$  × 48—51  $\mu$ . Pear like pseudoculus 9.6—10.2 $\mu$  long, with reverse "," shaped median eleft, PR=8-8.3. The canal of the maxillary gland has sausageshaped part, which bearing a pair of smooth elliptic decorations on the distal end. The proximal canal is half as long as the sausage part.

Foretarsus 43  $\mu$  long, claw 11.2  $\mu$  long, TR = 3.8. Dorsal sensilla t-1 short and thin, BS = 0.7; t-2 thin and long; t-3 stout. Exterior sensillae a, b, c, d, e, f, g and interior sensillae a', b'-1, b'-2, c'-1, c'-2 are all in same shape but more or less varied in length. Midtarsus 19  $\mu$  long, and claw 9.6—10 $\mu$ . Hindtarsus 21  $\mu$ , claw 10—11  $\mu$ .

Comb on abdominal segment M is rectangular, fringed with 8-9 irregular sharp teeth posteriorly. Basal apodeme of female genitalis is thin and weak. Male unknown.

Syntype: 299, Kangding, Sichnan Province, 2650M, 7, II, 1985.

Maturus junior and Larva I are also recorded.

Note: This new species is different from all the known species of Hesperentomon in the chaetotaxy of stern. N-N.

2. Hesperentomon kangdingensis sp. nov. (Figs. 9-13)

Total length 1500—1598  $\mu$ . Head 150—155  $\mu \times 102$ —106  $\mu$ . Pcar like pscudoculus 15.5—16  $\mu$  long, with "," shaped median cleft, PR = 9.6—9.7. The canal of the maxillary gland has sausage-shaped dilatation and bearing a mulberry shaped decoration on its distal end. The proximal canal is slightly narrower and shorter than that of the sausage dilatation.

Foretarsus 96—99  $\mu$  in length, claw 25.6 $\mu$ , TR = 3.7-3.9. Empodium 4.8  $\mu$  long, EU = 0.19. Dorsal rensillae t-1 is thin and long, BS = 0.98; t-3 is stout and short. Sensillae a, b, c, d, e, f, g, a', b'-1, b'-2, c'-1 and

c'-2 are all filiform but slightly varied in length. Midtarsus 40-42  $\mu$  in length, and claw 21-22.5  $\mu$ . Hindtarsus 47-48  $\mu$  and claw 23  $\mu$  in length.

The thoracic and abdominal chaetotaxy are tabulated in table 1.

The female squama genitalis has weak basal apodeme and pointed acrostylus,

Syntype: 1\$17, Kangding, Sichuan Province, 2600M, 6, K, 1985.

Maturus junior, Larva I and Larva I are also recorded,

Note: This new species is closely related to  $H_*$  chinghalensis Yin 1982, but can be distinguished by the shape of the maxillary canal and the chactotaxy.

3. Condeellum dukouensis sp. nov. (Figs. 15-24)

Total length 821—891  $\mu$ . Head 90  $\mu \times 70\mu$ . Pseudoculus circular,  $13\mu \times 11\mu$ , withou leve!, PR =7. The canal of the maxillary gland with ball-shaped dilataion and the proximal part ending in a globular dilatation.

Foretarsus is  $45-47 \mu$  in length, claw  $12.2-12.8\mu$ , TR = 3.5-3.8. Empodium 2  $\mu$  long. EU = 0.16. Dorsal sensilla t-3 is stout and short. Exterior sensilla a stout, b is subequal to f both in shape and in length. Interior sensilla a' is similar to b in shape but is slightly longer than b. Midtarsus  $17.5 \mu$  in length, and claw  $13 \mu$ , hindtarsus  $21 \mu$  and claw  $13 \mu$  in length.

Stern. We with 4 setac. The first and second abdominal appendages are 2-segmented, each with 4 setac and the third one is unisegmented with 2 setac. Comb on abdominal segment We is rectangular, fringed with 8—9 teeth among which the outer 2 teeth are much longer. The female equama genitalis has a pointed acrostylus.

Syntype: 299, Dukou, Sichuan Province, 1155M, 26, K, 1985.

Note: This new species is similar to C. crucis Tuxen et Imadaté 1975, but it can be distinguished by the shape of pseudoculus, the chaetotaxy and the number of setae on the third abdominal appendages.
